

A Black Finish for Fasteners that can Really Take It!

TUFF - BLACK 2500

Black finishes on fasteners are often subjected to harsh automatic sorting and/or patching operations prior to installations on vehicles and components. This harsh treatment can remove the black color or greatly reduce the corrosion resistance of the finish - or BOTH!

After many years of experience, CPI has succeeded in developing the right combination of black zinc nickel finishing technology and proper application technique of the topcoat to ensure a black finish that can maintain its look and corrosion resistance even after sorting TUFF-BLACK 2500.

**Below is a photo of production plated parts that were sorted and then salt sprayed.
The red rust appeared at 2,700 hours.**
